

Editing an image to get a transparent background

You need to start by having an image saved on your computer as a jpeg file.

1. Open **www.pixlr.com**
2. Open the Image Editor and then Open a file on your computer
3. Add a **new layer**
4. **Unlock** the background layer by double clicking the padlock
5. Move the background layer **on top** of the new layer by using the up arrow

6. Select the **Magic Wand** tool and click the background to select it
7. Hit the **Delete** key – the background of the image should become transparent

8. Go **File > Save**
9. **IMPORTANT:** make sure you save your image as a **PNG file**. This is the only way you're getting a transparent background!
10. Save the image and then use it in your presentation or webpage.
