Micro:bit Programming - sensors

There is a light sensor on the microbit.

You can get the light reading using:

```
display.read_light_level()
```

This value would need to be stored in a variable and then displayed.

```python
# program to measure temperature
from microbit import *

while True:

    light = display.read_light_level()

    if button_b.is_pressed():
        display.scroll(light)

```
