Flowol - Subroutines

Subroutines are used to:

- simplify your code to make it easier to read (or for someone else to read)

- avoid having to write the same block of code a number of times

- break a bigger problem into smaller steps

Subroutines are an important idea in computer programming

Flowol - Subroutines

Subroutines are smaller programs which run inside larger programs

1. Drag out a new **START** block

2. Make the block a **SUB** (not a START!)

3. Give the SUB a sensible name

4. Code the SUB

5. End with a **STOP** block
