

Photoshop – the Lighthouse

The lighthouse image needs lots of work.

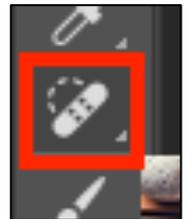

Straighten and crop

1. Use the **Crop Tool** to straighten the image – the **Straighten** button is at the top
2. Then **crop** the image using the **rule of thirds** – get the horizon on a third and aim to place the lighthouse on the spot where two thirds cross

Removing objects

3. Use the **Spot Heal Tool** on the **left toolbar** to remove the building at the bottom of the image
4. At the **top**, make the brush big enough to cover the building
5. **IMPORTANT:** Make sure you're using a 100% hard brush
6. Click **once** on the image where one of the building is

Black and White

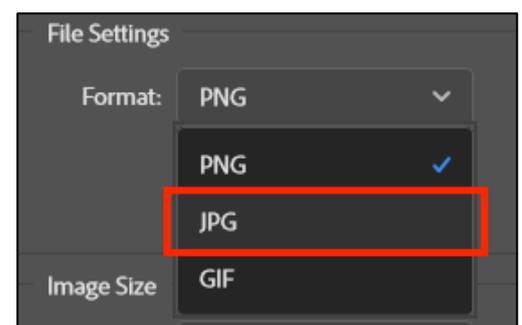

Make the image black and white

7. At the top, click **Layer > New Adjustment Layer > choose Black & White**
8. Click **OK** if a pop up box appears
9. The image turns black and white. That's fine for now – there's no need to use the sliders

Export the image

To use the image you need to **export** it – not just save it

10. Click **File > Export**
11. At the **top right**, change PNG to **JPG** and click **Export** at the **bottom**

Colour the lighthouse

A more advanced technique is to select the lighthouse and make it colour – while the rest of the image stays black and white

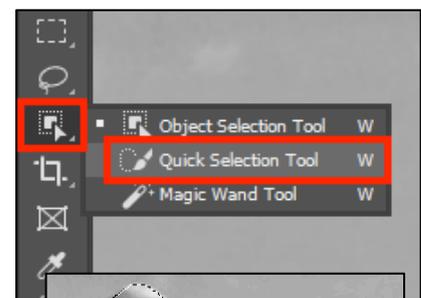

12. Make sure you're clicked on the **black and white layer** in the layer stack at the **bottom right**

13. Use the **Zoom Tool** at the **bottom** of the **left toolbar** to zoom in on the lighthouse. This will make the next bit easier

14. Find the **Object Selection Tool** on the **left toolbar** – it's just above the crop tool

15. **IMPORTANT: Click and hold** the mouse down on the **Object Selection Tool** and choose the **Quick Selection Tool** from the toolbar

16. Use the **Quick Selection Tool** to select the area of the lighthouse on the image – click and drag the tool carefully over the lighthouse area. Dashed lines that surround the area you have selected

17. If you accidentally select too much, use the **– (minus) button** at the **top left** to deselect an area.

Flip-flop between **+** and **–** until you get it right

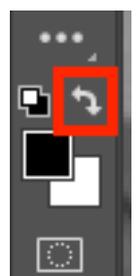

If you need to start over, click **Select** at the top > choose

Deselect to clear all the selection

18. Switch to the **Brush Tool** – this is under Spot Heal

19. At the **bottom** of the **left toolbar**, make sure the colour is set to **black**- use the little arrow to switch it if you need to

20. **Paint** over the lighthouse using the brush – the colour will show through
You can make the **brush bigger** at the top to help

21. **Layer > New Adjustment Layer > Hue/Saturation** – use the Hue slider to change the colour and the Saturation slider to brighten the colour

22. Now save your image and then export it so that you can use it
