# CD Cover – advanced selective colour

You need an image that you've picked out selective colours on to do this

1. Open **PhotoPaint** – press **Alt + S** to get rid of the pop up
2. Click **File** > **Open** > find the image you want to use and open it
3. On the <u>right panel</u>, make sure you're clicked on the <u>top</u> layer – this should be the Grayscale layer

4. **Object** > **Create** > **New Lens** > **Hue/Saturation/Lightness** > **OK**
5. Change the **Hue**. This will make the image change colour

6. On the <u>left toolbar</u>, switch to the **Brush Tool**
7. At the <u>top</u>, change the size of the brush:
   - start by changing the **brush type** to **Round 100** – this brush has a **hard edge** – that's what we want
   - then at the <u>top</u>, change the size up to **200** to start with
8. At the <u>bottom</u> of the **left toolbar** is a colour selector. Make sure Black is on top
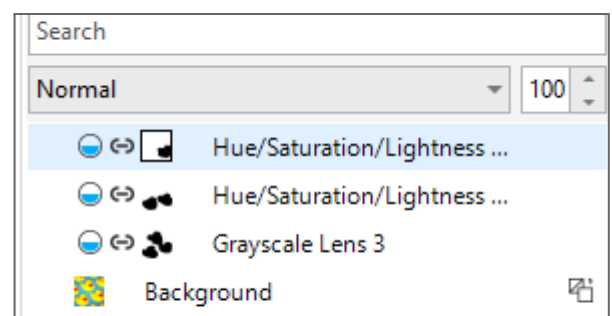

9. On the **Hue/Saturation layer**, start **painting** over the top of part of the image. This will **reveal** the colour underneath again
   You can be quite basic here – you won't reveal too much
10. To correct mistakes, switch the **brush colour** to **white** – use the **double headed arrow** at the <u>bottom</u> of the **left toolbar**

11. Now add a **second Hue/Saturation/Lightness** layer and repeat the process to get three colours

Once you're done, make sure to **save your work** before **adding text**
